PANEL DISCUSSION

13:30 - 15:00 CO.7: Social Acceptance of Ubiquitous-PV: The Era of Integrated Photovoltaics

Moderators: Mirella de Falco
University of Rome, Italy
Dr. Alexis Pascaris
NREL, Golden, USA

This session will explore the socio-political aspects of integrated photovoltaics (PV) from different perspectives and disciplinary fields with the aim of elevating diverse topics relevant to social perspectives and acceptance of new technologies, such as energy justice, economics, policy, and landscape design. Session panelists will provide high-level overviews of the various integrated PV applications (agrivoltaics, aquavoltaics, building-integrated PV) with an emphasis on the socio-political aspects related to each application. To build on the value of social perspectives, session panelists and audience members will participate in a "back casting" exercise to develop a roadmap for more successful research and development of integrated PV. This interactive and interdisciplinary approach to identifying the policies, programs, events, partnerships, and technological developments needed to address implementation barriers will enable researchers and practitioners to improve the role of integrated PV in the energy transition.

PANEL DISCUSSION

13:30 - 15:00 DO.13: Renewables 24/7: The challenges of integrating renewables into the future Electricity System

Moderators: Hubert Fechner
Austrian Technology Platform PhotoVoltaic (TPPV), Austria
Gehard Mütter
Austria

A sustainable energy transition and a decarbonization of the power sector requires a complete replacement of the use of coal, natural gas and nuclear plants. Traditionally, those are the main generation sources of the "Base Load Power", understood as the minimum amount of electric power needed to be supplied to the electrical grid at a span of time.

The intermittence in time and location of most renewables have been presented historically as the hurdles that trigger operational, technical and scientific challenges in their effective integration granting still reliability and stability to the electricity grid.

So, what would be needed to be done in Electricity Grid so the power could be entirely provided by renewable energy sources 24/7?

A group of top Electricity System experts, covering the different angles of these challenges will discuss aspects like: High penetration of Renewables (with a focus on PV), digitalisation of the distribution grids, local load management incentives, storage and other flexibility enablers of the grid, PV revenues on the energy market at peak PV times, regulatory barriers or democratization of the energy sector.
